Answers

1. B

   A collection holds a group of objects only. A collection cannot hold a group of primitive type values. The only solution for this limitation is wrapping each one of the primitive type values with an object of its wrapper class type (e.g. Wrapping each double value with an object of type Double).

2. A

   The elements the ArrayList object holds are sorted according to their name's length. The shortest names of all elements' names is "a".
